

# APIVizer MCP Setup Guide

Connecting AI Assistants via MCP Protocol

Supports: GitHub Copilot | Google Gemini | OpenAI ChatGPT  
Anthropic Claude | Ollama | LM Studio | Any MCP-Compatible LLM

Version: 4.0.0 PHANTOM | May 2026

## GitHub Copilot (VS Code & JetBrains)

---

1. Open VS Code or JetBrains IDE with GitHub Copilot extension installed
2. Open Settings > Copilot > MCP Servers
3. Add new MCP server configuration:  
`Name: APIVizer`  
`Command: python`  
`Args: ["/path/to/apivizer_mcp_server.py"]`
4. Save and restart the IDE
5. In Copilot Chat, type: @apivizer scan my API collection
6. Or run: `python apivizer.py -c collection.json -e env.json --exploit --opus`

# Google Gemini

---

1. Install the Gemini MCP Bridge: `pip install gemini-mcp-bridge`
2. Set your Gemini API key: `export GEMINI_API_KEY=your_key_here`
3. Create config file `gemini_mcp.json`:

```
{"model": "gemini-2.0-flash", "mcp_servers": [  
  {"name": "apivizer", "command": "python", "args": ["apivizer_mcp_server.py"]}  
]}
```

4. Start bridge: `gemini-mcp-bridge --config gemini_mcp.json`
5. Or use APIVizer standalone: `python apivizer.py --exploit --ai`

## OpenAI ChatGPT

---

1. Use the OpenAI API with function calling (MCP adapter pattern)

2. Install adapter: `pip install openai-mcp-adapter`

3. Set API key: `export OPENAI_API_KEY=sk-your_key_here`

4. Create config:

```
{"model": "gpt-4o", "mcp_servers": [  
  {"name": "apivizer", "command": "python", "args": ["apivizer_mcp_server.py"]}  
]}
```

5. Start: `openai-mcp-adapter --config config.json`

6. APIVizer works standalone without OpenAI: `python apivizer.py --exploit`

## Anthropic Claude

---

1. Claude supports MCP protocol natively via Claude Desktop
2. Open Claude Desktop > Settings > Developer > MCP Servers
3. Add server configuration:

```
    {"mcpServers": {"apivizer": {  
      "command": "python",  
      "args": ["/path/to/apivizer_mcp_server.py"]  
    }}}  
```
4. Restart Claude Desktop
5. Ask Claude: "Use APIVizer to scan my API for vulnerabilities"

## Ollama (Local/Self-Hosted)

---

1. Install Ollama: <https://ollama.com/download>
2. Pull a model: `ollama pull llama3.1:8b`
3. Install MCP bridge: `pip install ollama-mcp-bridge`
4. Start APIVizer MCP server: `python apivizer_mcp_server.py`
5. Connect: `ollama-mcp-bridge --model llama3.1:8b --mcp-server localhost:3000`
6. APIVizer works fully standalone without Ollama

## LM Studio (Local)

---

1. Download LM Studio: <https://lmstudio.ai/>
2. Load a model (e.g., Mistral 7B, Llama 3.1)
3. Enable API server in LM Studio settings
4. Install bridge: `pip install lmstudio-mcp-bridge`
5. Connect: `lmstudio-mcp --endpoint http://localhost:1234 --mcp apivizer_mcp_server.py`
6. Or use APIVizer directly: `python apivizer.py --exploit --ai`

## Important Notes

- > APIVizer works 100% standalone - no AI connection required for full exploitation.
- > The built-in AI engine provides behavioral learning and adaptive fuzzing without external AI.
- > MCP integration is OPTIONAL and adds AI assistant capabilities for analysis and reporting.
- > All scan data stays local - no data is sent to AI providers unless explicitly connected.
- > Use --exploit flag for standalone mode, --ai or --opus for AI-enhanced mode.
- > The MCP server file (apivizer\_mcp\_server.py) is optional and only needed for external AI connection.
